

# Nasolabial folds

Skin wrinkles can be treated with intradermal injection BUT if the crease of the nasolabial fold is very deep, subdermal volumizing injection gives the best result.

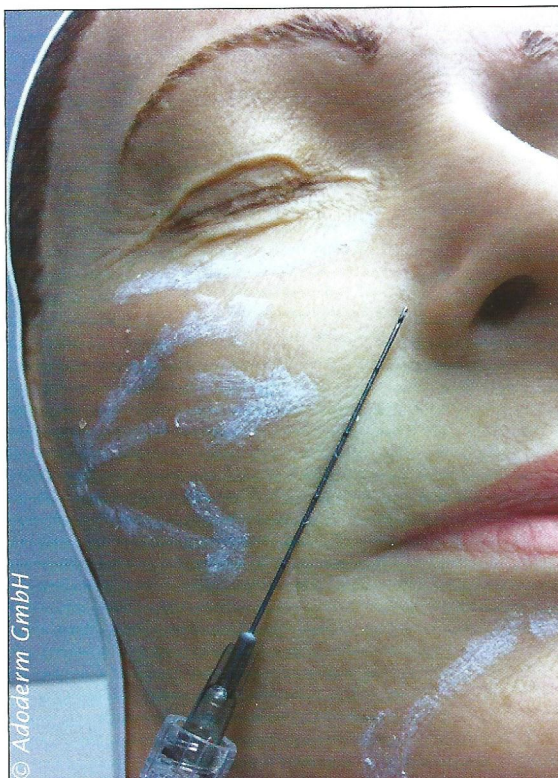

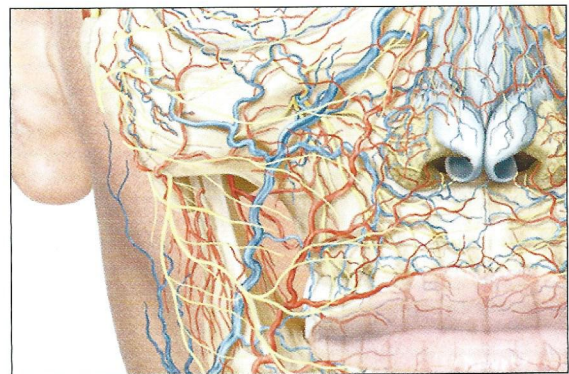

Intradermal injection is not volumizing but merely smoothing the folds and the skin surface. To reduce the depth of the folds – only deep, subdermal injection and the lift of the skin gives satisfactory results.

**VARIODERM®**  
**Basic / Plus / Subdermal**

**CAUTION!**  
*Be aware of the angular artery and vein.*

*Cannula injection technique*

*Needle injection technique*
